<b>4.12 Membership</b> .....	31

## ICES (SCC-39) Annual Report: 2013 – 2014

### 1. Scope

“Development of standards for the safe use of electromagnetic energy in the range of 0 Hz to 300 GHz relative to the potential hazards of exposure of humans, volatile materials, and explosive devices to such energy. Such standards will be based on established effects and include safety levels for human exposure to electric, magnetic and electromagnetic fields, including induced currents from such fields, methods for the assessment of human exposure to such fields, standards for products that emit electromagnetic energy by design or as a by-product of their operation, and environmental limits.”

The structure of ICES/SCC-39 is shown below in Figure 1.

### 2. Administrative Committee (AdCom)

#### 2.1 AdCom Membership

The membership of the AdCom is shown below in Table 1. New members include Dr. Jafar Keshvari (Microsoft) who replaced Dr. Kainz as TC34 Chairman; Dr. Akimasa Hirata (Nagoya Technical Institute), who chairs a new subcommittee (SC6) established to address dosimetry and induction model issues at low frequencies; and J Patrick Reilly as an “at large” member recognized internationally for his expertise in low-frequency bioeffects. Additional “at large” members are being sought, especially young scientists and engineers from outside the US.

#### 2.2 AdCom Activities

AdCom members continue to explore paths toward international harmonization of standards for the safe use of electromagnetic energy. The increased international ICES membership, the IEEE Get Program, and the agreement with the NATO Standardization Agency to provide a new civil standard to replace NATO standards adopted under Standards Agreement 2345 are providing greater influence within the international community. ICES representatives regularly participate and give presentations on the role of ICES in international standard setting at important international meetings, including meetings sponsored by, PIERS (Progress in Electromagnetics Research Symposium), ITU (International Telecommunication Union), IEC (International Electrotechnical Commission), the Bioelectromagnetics Society (BEMS), WHO EMF Project workshops, and workshops sponsored by the EU Presidency and the Commission on Worker Safety. ICES members also play a role in drafting public documents on contemporary RF safety issues, e.g., the former Chair of the ICES Membership Committee, Tom McManus, was the main author of the WHO Model Legislation document, which included finding common ground where different opinions existed. ICES Chairman Bodemann represents ICES at the WHO International Advisory Committee meetings; TC34 Chairman Keshvari and TC95 member Klauenberg represent ICES at IEC TC106 and NATO Standardization Agency meetings, respectively.

#### 2.3 Highlights (2013 – 2014)

- During the past year, the Administrative Committee (AdCom) met in Plantation, FL, Pismo Beach, CA and several times by teleconference. In addition to other duties, the ICES AdCom plans and arranges meetings of TC34 and TC95 and their subcommittees, and approves (or rejects) applications for membership on the ICES technical committees. ICES Chairman Dr. Ralf Bodemann (Siemens AG, Germany),

TC95 Membership Chairman Dr. Michael Murphy (US Air Force Research Laboratory – recently retired), TC34 Chairman Dr. Jafar Keshvari (Microsoft), TC95 Chairman Dr. C-K Chou (Motorola Solutions – recently retired), and others have become ICES roving ambassadors to the EU member states and other countries. Each has given numerous presentations in support of ICES and the IEEE open consensus process at meetings throughout the world. TC95 Chairman Dr. Chou, for example, has given presentations in Bulgaria, China, India, Malaysia, Taiwan and the United States. Dr. Murphy is Past President of the Bioelectromagnetics Society (BEMS – the pre-eminent Society for the study of the interaction and effects related to the exposure of living systems to electric, magnetic and electromagnetic fields at frequencies below 300 GHz). He and several other ICES members serve as an ICES liaison to the BEMS Board of Directors.

In May 2009, the IEEE entered into a Technical Cooperation Agreement (TCA) with the NATO Standardization Agency (NSA) in order to share knowledge of each organization’s standards development activities. The objective of the agreement is to avoid duplication of technical standards whenever possible. In addition, on 30 July 2009, ICES entered into a Specific Agreement with the NSA for the conversion of the standard covered by NATO STANAG 2345 Med. (Edition 3) into an IEEE Standard. A result of this agreement, IEEE C95.1-2345-2014, “IEEE Standard for Military Workplaces—Force Health Protection Regarding Personnel Exposure to Electric, Magnetic and Electromagnetic Fields, 0 Hz to 300 GHz,” was approved 16 May 2014 and published 30 May 2014. On 5 June 2014, Dr. B Jon Klauenberg, Custodian of STANAG 2345 and member of the PC95.1-2345 editorial working group, briefed representatives of the NATO senior standards body “Committee of Standardization” on the transition and IEEE Std C95.1<sup>TM</sup>-2345; on 3 September 2014, Dr. Klauenberg briefed the NATO Force Health Protection Working Group (FHPWG) on the history of both the IEEE Standard and STANAG 2345. NATO nations have until 30 November to self-identify as having EMF health and occupational safety expertise to be included in the ratification pool.

- In accordance with a joint IEEE/DoD agreement, IEEE Standards C-95.1-2005, C95.1-2345-2014, C95.3-2002, C95.3.1-2010, C95.6-2002 and C95.7-2014 are now publicly available at the IEEE SA Get Program through DoD Sponsorship. In the past, international recognition of the C95 standards was hindered somewhat by their cost. During the months of January through October, 2014, 2346 standards have been downloaded, the majority by “Commercial Users” followed by “Students,” Safety Risk Managers” and “Research Scientists.”
- Following circulation of an IEC TC106 “Q” document titled “Establishment of joint IEC TC106 – IEEE SCC-39/TC34 projects on the evaluation of specific absorption rate (SAR) using numerical techniques,” ICES TC34 submitted four draft standards to be jointly developed by IEC and IEEE and published as dual logo standards. All four projects have been approved. Of the four, the following three are in IEEE Sponsor ballot and 2<sup>nd</sup> stage committee drafts in the IEC process.
  - IEC/IEEE P62704-1 (general requirements for FDTD simulations of SAR)
  - IEC/IEEE P62704-2 (specific requirements for SAR from vehicular mounted antennas)
  - IEC/IEEE P62704-3 (specific requirements for SAR from mobile telephones)

A committee draft for the fourth, IEC/IEEE P62704-4 (general requirements for FEM simulations for modeling vehicle-mounted antennas and personal wireless devices) has been under development but with little progress. TC34 Chairman Keshvari is in contact with the WG Chairman to decide whether the project should continue or be incorporated into P62704-1 and the project withdrawn.

- IEEE 1528-2013, IEEE Recommended Practice for Determining the Peak Spatial-Average Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques, was approved at the June 2013 SA Standards Board meeting and was published September 2013. Note that IEEE 1528 and the IEC 62209 standards are developed by essentially the same working group. The intent is to eventually issue a single dual logo IEC/IEEE standard.
- ICES provided comments in response to a *Further Notice of Proposed Rule Making* (FNPRM) and *Notice of Inquiry* (NOI) issued by the Federal Communications Commission in the matter of Reassessment of FCC Radiofrequency Exposure Limits and Policies and Proposed Changes in the Commission's Rules Regarding Human Exposure to Radiofrequency Electromagnetic Fields (ET Dockets ET 13-84 and 03-137, respectively) and also responded to comments submitted by others in the same proceedings. In both cases, ICES encouraged the FCC to base any changes to their current exposure guidelines on IEEE C95.1-2005 (frequencies above 3 kHz) and, should the FCC extend its scope, C95.6-2002 (frequencies below 3 kHz).
- The World Health Organization (WHO) is preparing a large document entitled, "Radio Frequency fields: Environmental Health Criteria Monograph" and has invited individuals and organizations to submit comments and suggestions on the chapters that have already been written. The document was circulated to TC95 for comment; the comments were edited and circulated as a ballot for approval. The ballot was approved unanimously. The comments will be sent to IEEE legal before submitting to WHO. The WHO deadline for comments is December 15, 2014.

## **2.4 Policies and Procedures**

The ICES Policies and Procedures were accepted by AudCom and the SASB at December 2012 meetings. The Working Group P&Ps, based on the September 2012 Working Group Baseline, were found to be without issue by AudCom at the August 2013 meeting.

## **2.5 Budget**

### **2.51 TC34**

TC 34 has no specific budget or operating expenses.

### **2.52 TC95**

The operating expenses and budget for TC95 are found in 4.2.

## **2.6 Standards**

Table 1 lists the SCC-39 published standards and their status:

**Table 1(a)**  
**SCC-39 Standards**

<b>Standard</b>	<b>Title</b>
<b>TC34 Standards</b>	
1528-2013	IEEE Recommended Practice for Determining the Peak Spatial-Average Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques
1528a-2005	IEEE Recommended Practice for Determining the Peak Spatial-Average Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques - Amendment 1: CAD File for Human Head Model (SAM Phantom)
<b>TC95 Standards</b>	
1460-1996	IEEE Guide for the Measurement of Quasi-Static Magnetic and Electric Fields
C95.1-2005	IEEE Standard for Safety Levels with Respect to Human Exposure to Radio Frequency Electromagnetic Fields, 3 kHz to 300 GHz
C95.1a-2010	IEEE Std for Safety Levels with Respect to Human Exposure to Radio Frequency Electromagnetic Fields-Amend 1: Specifies Ceiling Limits for Induced & Contact Current
C95.1-2345-2014	IEEE Standard for Military Workplaces—Force Health Protection Regarding Personnel Exposure to Electric, Magnetic and Electromagnetic Fields, 0 Hz to 300 GHz
C95.2-1999	IEEE Standard for Radio-Frequency Energy and Current-Flow Symbols
C95.3-2002	IEEE Recommended Practice for Measurements and Computations of Radio Frequency Electromagnetic Fields With Respect to Human Exposure to Such Fields
C95.3.1-2010	IEEE Recommended Practice for Measurements and Computations of Electric, Magnetic and Electromagnetic Fields with Respect to Human Exposure to Such Fields, 0 Hz to 100 kHz
C95.4-2002	IEEE Recommended Practice for Determining Safe Distances From Radio Frequency Transmitting Antennas When Using Electric Blasting Caps During Explosive Operations
C95.6-2002	IEEE Standard for Safety Levels With Respect to Human Exposure to Electromagnetic Fields, 0—3 kHz
C95.7-2014	IEEE Recommended Practice for Radio Frequency Safety Programs, 3 kHz to 300 GHz

**Table 1 (b)**  
**SCC-39 Standards—Status**

<b>Standard</b>	<b>Year</b>	<b>Expiration Date</b>	<b>SASB Approval Date</b>	<b>SASB Reaffirmation Date</b>	<b>ANSI Approval Date</b>
1460	1996	12/31/2018	12/10/1996	06/12/2008	06/5/1997

\*ANSI BSR8/Public review start date.

## 2.7 ICES Websites

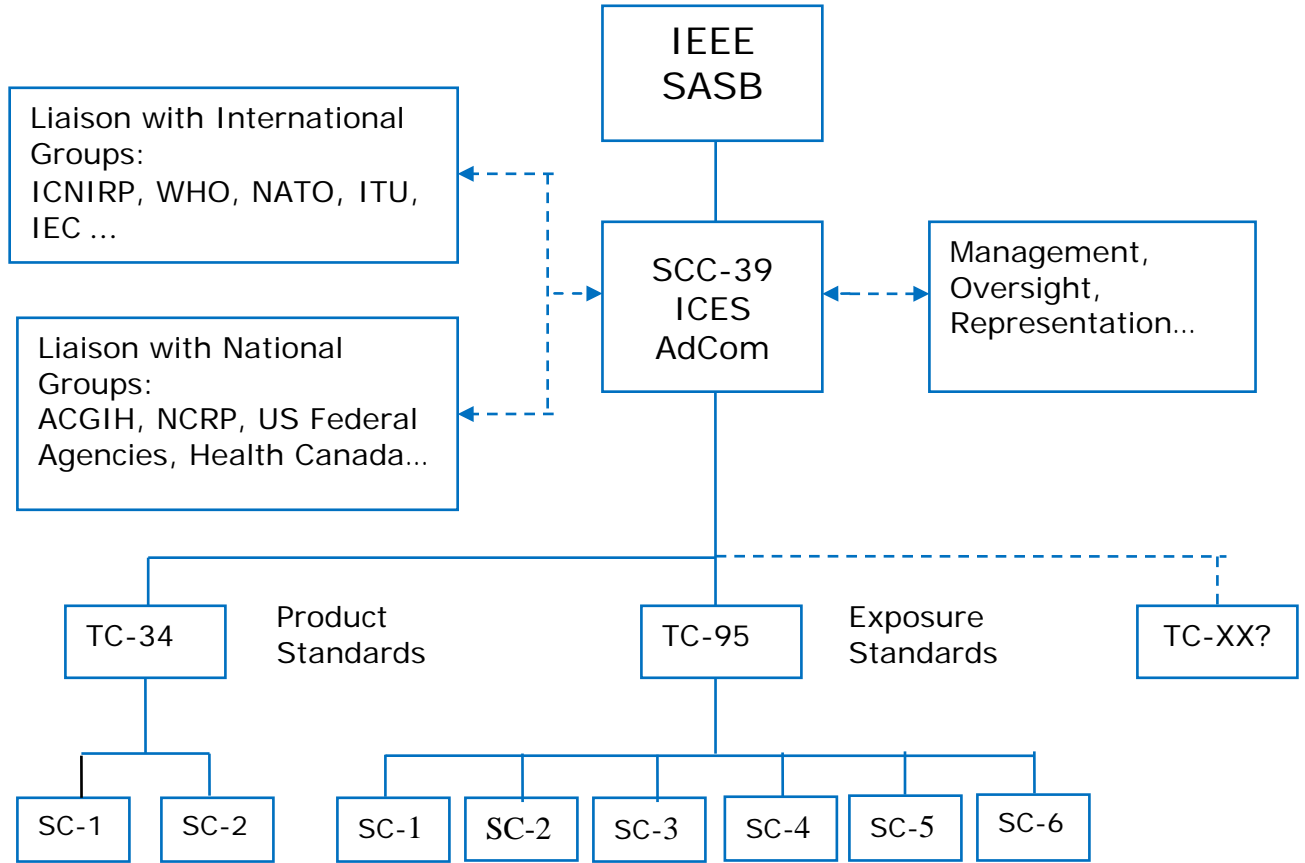

AdCom members continually provide material for the ICES website (<http://www.ices-emfsafety.org/>), which includes separate sections for TC34 and TC95 with both public and private pages for the main committees and the subcommittees (ICES owns the domain). The website is maintained by NEMA. File Transfer Protocol (FTP) services for subcommittee activities are included. In addition, TC34 maintains the following websites:

<http://grouper.ieee.org/groups/scc34/sc2/> (public),  
<http://grouper.ieee.org/groups/scc34/sc2/private/moindex.html> (private).

The website is now in the process of being updated to present a more contemporary appearance (see URL below for draft version).

<http://www.nemawebservices.org/ices/2/index.html>

**TC-34**

- SC-1: Measurement Techniques
  - WG-1: SAR-Handheld Devices
- SC-2: Computational Techniques
  - WG-1: General FDTD Requirements
  - WG-2: Specific FDTD Requirements
  - WG-3: FDTD Requirements for Modeling Devices
  - WG-4: General FEM Requirements

**TC-95**

- SC-1: Measurements and Calculations
- SC-2: Warning Signs, Hazard Communications
- SC-3: Low-frequency Exposure Values
- SC-4: High-frequency Exposure Values
- SC-5: Electro-explosive Devices
- SC-6: EMF Modeling and Dosimetry

### **3. Technical Committee-34**

#### **3.1 Scope**

The scope of Technical Committee 34 (TC34) is “The development of product performance standards relative to the safe use of electromagnetic energy for specific products that emit electromagnetic energy at frequencies between 0 and 300 GHz, i.e., the frequency range covered by the basic restrictions and maximum permissible exposure (MPE) values developed by the IEEE International Committee on Electromagnetic Safety (ICES).” (The scope remains the same as the scope of SCC-34 before reorganization.) Included in the scope are standards, guides and recommended practices that describe measurement and computational protocols for determining compliance with the basic restrictions and the derived exposure values, e.g., maximum permissible exposure values (MPEs), exposure reference levels (ERLs) found in IEEE Stds C95.1 and C95.6 and in other relevant national and international standards and guidelines.

#### **3.2 Reorganization**

Following combining SCC-28 (exposure standards) and SCC-34 (product standards) into a single committee (SCC-39) the structure and activities of SCC-34 (now TC34) were examined and a decision was made to re-organize the committee. Originally, TC34 consisted of the following three subcommittees: SC1 (Pleasure-boat radar), SC2 (SAR evaluation), and SC3 (Effectiveness of RF-protective clothing). Initially there was considerable interest in the activities of SC1 and SC3, but this interest has dwindled during the past few years. The decision was made to disband SC1 until there is evidence of increased interest. SC3 was also disbanded. The IEEE EMB-S Committee on Man and Radiation (COMAR) was asked to consider drafting a technical information statement on pleasure boat radar. The remaining subcommittee, SC2, was divided logically into two subcommittees—SC1 (SAR evaluation—measurement techniques) and SC2 (SAR evaluation—numerical techniques). SC2 includes the following four working groups:

- WG-1 (General requirements for using the FDTD method for SAR calculations);
- WG-2 (Specific requirements for FDTD Modeling of vehicle mounted antenna configurations);
- WG-3 (Specific requirements for FDTD modeling of mobile phones/personal wireless devices);
- WG-4 (Requirements for using the finite-element method for SAR Calculations, specifically vehicle-mounted antennas and personal wireless devices).

The two subcommittees and their working groups are very active and hold face-to-face meetings and teleconferences several times per year. The face-to-face meetings are usually held in conjunction with IEC TC106/MT-1, which has a similar scope and with whom TC34 has a Category D Liaison.

#### **3.3 Membership Roster**

See Table TC34-2 (NOTE—All members listed are members of TC34, TC34/SC1 and TC34/SC2, i.e., the members of SC1 are also members of SC2 and also members of TC34, and vice versa.)

### **3.4 Meetings (2013-2014)**

#### **3.4.1 Past meetings**

- 20 – 24 January, 2014, Fremont, CA, USA
- 22 October, 2014, Frankfurt Germany (in conjunction with the TC106 Plenary and CISPR meetings)

#### **3.4.2 Future meetings**

- 5 February 2015, San Francisco, CA
- 14 May, 2015 , Paris, France
- 8 October, 2015, Venice, Italy

### **3.5 Subcommittee activities**

#### **3.5.1 Subcommittee 1 (SAR evaluation – measurement techniques)**

- Joint meetings were held (and continue to be held) with IEC TC-106 MT1 to work on maintenance of IEC 62209 “Human exposure to radio frequency fields from hand-held and body-mounted wireless communication devices - Human models, instrumentation, and procedures - Part 1: Procedure to determine the specific absorption rate (SAR) for hand-held devices used in close proximity to the ear (frequency range of 300 MHz to 3 GHz) and Part 2: Procedure to determine the specific absorption rate (SAR) for mobile wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz).” (IEC 62209-1 and 62209-2 were published in 2005 and 2010, respectively.) The SC1 activities are coordinated with IEC TC106 MT1 with the intent of publishing a single dual-logo international standard to replace IEEE 1528-2013, “IEEE Recommended Practice for Determining the Peak Spatial-Average Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques.”
- **P1528:** The revision of IEEE 1528 (which extends the frequency range of SAR measurement standards up to 6 GHz) was approved at the June 2013 SA Standards Board meeting. And published in September 2013. SC1 is collaborating with IEC MT-1 toward the development of standards for devices held within 20 cm of the body (including body-worn, hand-held and desktop devices), and addressing harmonization with IEC P62209-2 with the goal of developing a jointly developed international dual-logo standard.

#### **3.5.2 Subcommittee 2 (SAR evaluation – numerical techniques)**

Following approval of four IEEE projects as IEC/IEEE jointly developed standards projects, PARs P1528.1, P1528.2, P1528.3 and P1528.4 were withdrawn and new PARs with the assigned IEC project numbers were submitted and approved.

##### **3.5.2.1 IEC P62704-1 (formerly P1528.1):**

- The draft of IEC/IEEE 62704-1 was completed in September 2012 and submitted to IEC as a committee draft (ICD) for comment by the national committees. The comment period ended in January 2013. The text has been reviewed, revised and a 2<sup>nd</sup> CD issued. The draft is now undergoing IEEE Sponsor ballot. The initial ballot for P62704-1 closed in November 2013 and meets all thresholds for approval by the IEEE SASB. All comments on the IEC draft have been resolved and the revised

draft will be circulated as an IEC CDV early in 2015. Reference and model files will be available for download on the IEC server.

**3.5.2.2 IEC P62704-2 (formerly P1528.2):**

- The draft of IEC/IEEE 62704-2 was completed in September 2012 and submitted to IEC as a committee draft (1CD) for comment by the national committees. The comment period ended in January 2013. The text has been revised and a 2<sup>nd</sup> CD issued. The target date for completing the IEC CDV is 31 January, 2014. The draft is now undergoing IEEE Sponsor ballot—the initial ballot closed in October 2013 and meets all thresholds for approval by the IEEE SASB. All comments have been resolved and a revised draft will be circulated as a CDV in early 2015.
- Reference results for passenger and bystander exposure using different software are in good agreement (better than 16 %).

**3.5.2.3 P62704-3 (formerly P1528.3):**

- The draft of IEC/IEEE P62704-3 was completed in September 2012 and submitted to IEC as a committee draft (1CD) for comment by the national committees. The comment period ended in January 2013. The draft has been updated with the experiences obtained from the conducted inter-laboratory comparison and a 2<sup>nd</sup> CD issued. The target date for completing the IEC CDV was 31 January, 2014. The draft is now undergoing IEEE Sponsor ballot. The initial ballot closed in August 2013 and meets all thresholds for approval by the IEEE SASB. Comment resolution is still in process. Most of the comments have been resolved but there still remains a question regarding the need for benchmarking. TC34 Chairman Keshvari is in contact with the Mobile Manufacturers Forum as a source for CAD models for benchmarking.

**3.5.2.4 P62704-4 (formerly P1528.4):**

- An early version of a Recommended Practice has been produced that covers the same topics as P1528.1, P1528.2 and P1528.3 combined. The new P62704-4 draft closely follows the earlier PARs and frequently refers to them, while changing FDTD specific guidelines into finite element analysis (FEM)-specific guidelines.
- This project is progressing more slowly than the other three in the series. The working group is considering integrating this project into the next revision of P62704-1, in which case P62704-4 will be withdrawn.

**3.6 TC34 PARs**

**3.6.1 SC1 PARs**

(None)

**3.6.2 SC2 PARs**

**3.6.2.1 P62704-1 (Approved March 2011)**

**Title:** Standard for Determining the Peak Spatial Average Specific Absorption Rate (SAR) in the Human Body from Wireless Communications Devices, 30 MHz - 6 GHz. Part 1: General Requirements for using the Finite Difference Time Domain (FDTD) Method for SAR Calculations

**Status:** New Standard Project

**Project scope:** This standard describes the concepts, anatomical models for compliance assessments, techniques, validation procedures, uncertainties and limitations of the finite-difference time-domain technique (FDTD) when used for determining the spatial peak specific absorption rate (SAR) in standardized human anatomical models exposed to wireless communication devices. Recommendations for standardized anatomical models and general benchmark data for these models are provided. Specific SAR limit values (basic restrictions) are not included since these are found in other documents, e.g., IEEE C95.1 and IEEE C95.1a.

**Project purpose:** Document will not contain a purpose clause.

### **3.6.2.2 P62704-2 (Approved March 2011)**

**Title:** Standard for Determining the Peak Spatial Average Specific Absorption Rate (SAR) in the Human Body from Wireless Communications Devices, 30 MHz - 6 GHz. Part 2: Specific Requirements for Finite Difference Time Domain (FDTD) Modeling of Vehicle Mounted Antenna Configurations

**Status:** New Standard Project

**Project scope:** This standard describes the concepts, techniques, vehicle models, validation procedures, uncertainties and limitations of the finite-difference time-domain technique (FDTD) when used for determining the spatial-peak specific absorption rate (SAR) in standardized human anatomical models exposed to vehicle mounted antennas. Recommended vehicle models and general benchmark data for these models are provided. Antenna locations, operating configurations, exposure conditions and positions of persons exposed to the vehicle mounted antennas are defined. Intended users of this practice are (but are not be limited to) wireless communication devices manufacturers, service providers for wireless communication that are required to certify that their products comply with the applicable SAR limits and government agencies. Specific SAR limit values (basic restrictions) are not included since these are found in other documents, e.g., IEEE C95.1-2005 and IEEE C95.1a-2010.

**Project purpose:** Document will not contain a purpose clause.

### **3.6.2.3 P62704-3 (Approved March 2011)**

**Title:** Standard for Determining the Peak Spatial-Average Specific Absorption Rate (SAR) in the Human Body from Wireless Communications Devices, 30 MHz - 6 GHz. Part 3: Specific Requirements for Finite Difference Time Domain (FDTD) Modeling of Mobile Phones/Personal Wireless Devices

**Status:** New Standard Project

**Project scope:** The scope of this project is to describe the concepts, techniques, models, validation procedures, uncertainties and limitations of the finite-difference time-domain technique (FDTD) when used for determining the spatial-peak specific absorption rate (SAR) in standardized human anatomical models. These models are exposed to personal wireless devices, e.g. mobile phones. It recommends and provides guidance on modeling

of personal wireless devices and provides benchmark data for simulation of such models. It defines model contents and provides guidance on meshing and test positions at the anatomical models. This document does not recommend specific SAR values since these are found in other documents, e.g., IEEE C95.1 and IEEE C95.1a.

**Project purpose:** This standard will not contain a purpose clause

#### **3.6.2.4 P62704-4 (Approved December 2011)**

**Title:** Standard for Determining the Peak Spatial-Average Specific Absorption Rate (SAR) in the Human Body from Wireless Communications Devices, 30 MHz - 6 GHz: General Requirements for Using the Finite Element Method (FEM) for SAR Calculations and Specific Requirements for Modeling Vehicle-Mounted Antennas and Personal Wireless Devices.

**Scope:** This standard describes the concepts, techniques, models, validation procedures, uncertainties and limitations of the Finite-Element Method when used for determining the spatial-peak specific absorption rate (SAR) in standardized anatomical models exposed to wireless communication devices, including vehicle-mounted antennas and personal wireless devices, such as hand-held mobile phones. Guidance on modeling such devices and benchmark data for simulation is provided; model contents, meshing and test positions of the anatomical models are defined. This document does not recommend specific SAR values since these are found in other documents, e.g., IEEE C95.1-2005 (IEEE Standard for Safety Levels with Respect to Human Exposure to Radio Frequency Electromagnetic Fields, 3 kHz to 300 GHz.)

**Purpose:** This document will not contain a purpose clause.

### **3.7 Drafts**

#### **3.7.1 SC1 (IEEE 1528 Approved June 2013, published September 2013)**

#### **3.7.2 SC2 (Computational Techniques)**

Drafts of P1528.1, P1528.2, 1528.3 and P1528.4 (now IEC/IEEE P62704-1, -2, -3 and -4) were approved as dual-logo standards projects. The first three documents are in IEC stage 2CD and are in IEEE Sponsor ballot.

### **3.8 Objectives and goals for the past year and the TC's performance relative to meeting these goals and objectives.**

#### **3.8.1 SC1 (Measurement techniques)**

##### **3.8.1.1 Objectives (2014)**

- Continue to work with IEC TC106 to ensure harmonization of IEEE 1528-2013 and IEC P62209-2. (Met)

##### **3.8.1.2 Objectives (2015)**

- Continue following up on harmonization process with IEC P62209-2; seek jointly-developed dual-logo standards status with IEC.

### **3.8.2 SC2 (Numerical techniques)**

#### **3.8.2.1 Current levels of activity and milestones (2014)**

- P62704-1 – prepare CDV for IEC ballot. (Not met)
- P62704-2 – prepare CDV for IEC ballot. (Not met)
- P62704-3 – prepare CDV for IEC ballot. (Not met)
- P62704-4 – prepare 1 CD for circulation. (Not met)

#### **3.8.2.2 Objectives (2015)**

- P62704-1 – prepare CDV for IEC and IEEE ballot
- P62704-2 – prepare CDV for IEC and IEEE ballot
- P62704-3 – prepare CDV for IEC and IEEE ballot
- P62704-4 – decide whether this project should be withdrawn

### **3.9 Website**

A website and reflector was set up several years ago for SC2 (now SC1 and SC2) and operates successfully. All meeting minutes, action items, motions, and drafts are posted on the web – SC balloting is carried out electronically. The site has recently been updated and reorganized. Public areas contain links to other sites important for subcommittee activities, e.g., the USAF Dosimetry Handbook, Tables of Dielectric Properties of Tissues (Gabriel), schedules for meetings. A private area contains draft sections of the practice, the results of measurements on canonical models, etc.

The website URL is: <http://grouper.ieee.org/groups/scc34/sc2/>

A reflector was also set up. The address is [stds-ices-tc34@ieee.org](mailto:stds-ices-tc34@ieee.org)

### **3.10 IEEE Staff support requirements**

Originally, secretarial services for SC2 provided by the Cellular Telecommunications and Internet Association (CTIA) are now provided by volunteer committee members. Tricia Gerdon replaced Joan Woolery is the IEEE Staff Engineer for both TC34 and TC95—both of their engineering backgrounds and broad knowledge of IEEE procedures is invaluable to this committee.

### **3.11 Liaison with other committees**

Liaison with other committees occurs via the circulation of drafts, common meetings and common membership on committees such as the European Committee for Electrotechnical Standardization (CENELEC), IEC, ITU, the Association of Radio Industries and Businesses (ARIB) and other standards developing organizations, and through a “Category D” liaison with IEC TC106/MT-1. Coordination has also been established with IEEE societies, e.g., EMC-S via representation on the Standards and Advisory Coordination Committee (SACCom).

### **3.12 Issues: Joint IEC/IEEE development project: IEC 62209 and IEEE 1528**

Because of the close cooperation and overlap of membership and the desire for a single international standard, TC34 is considering IEC approval of IEEE 1528-2013 and IEC P62209 as a jointly developed IEC/IEEE standards project.

**Rationale:** IEC TC106/MT-1 (maintenance of IEC 62209) and IEEE TC34/SC1 have worked hand in hand to develop IEC 62209-1-2005 “Human Exposure to Radio Frequency Fields from Hand-held and Body-mounted Wireless Communication Devices - Human Models, Instrumentation, and Procedures - Part 1: Procedure to Determine the Specific Absorption Rate (SAR) for Hand-held Devices used in Close Proximity to the Ear (Frequency Range of 300 MHz to 3 GHz),” IEC 62209-2-2010 “Human exposure to radio frequency fields from hand-held and body-mounted wireless communication devices - Human models, instrumentation, and procedures - Part 2: Procedure to determine the specific absorption rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz” and IEEE 1528-2013 “IEEE Recommended Practice for Determining the Peak Spatial-Average Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques.” During the development of these standards a number of TC34 members also participated on the IEC PTs, sharing drafts to ensure harmonization. Thus the three existing standards were developed jointly by many of the same people but issued separately as three distinct standards. During the past three years, TC34/SC1 and MT-1 have held a number of face-to-face meetings and a number of joint teleconferences. While these exchanges are dedicated to P62209 business or TC34 business (to limit the time), the discussion topics are common to both WGs and members of both WGs participate.

These are important standards for the wireless communications industry where harmonization is critical. Having a single dual logo standard is important for a variety of reasons and both 62209 Project Team Leader and the leadership of TC34/SC1 believe that IEC 62209 and IEEE 1528 are ideal candidates for such a project.

### **3.13 Membership**

See Table TC34-2 for detailed membership information.

**Table TC34-1  
TC34 Leadership**

<b>OFFICE</b>	<b>NAME</b>	<b>AFFILIATION</b>	<b>COUNTRY</b>

## **4. Technical Committee 95**

### **4.1 Scope**

The scope of ICES TC95 is:

“Development of standards for the safe use of electromagnetic energy in the range of 0 Hz to 300 GHz relative to the potential hazards of exposure of man, volatile materials, and explosive devices to such energy. It is not intended to include infrared, visible, ultraviolet, or ionizing radiation. The committee will coordinate with other committees whose scopes are contiguous with TC95.” (The scope remains the same as the scope of SCC-28 before reorganization.)

### **4.2 Budget**

TC TC95 manages its funds through the IEEE Concentration Banking System and NetSuite. Funding, which is obtained through meeting registration fees, is used to cover meeting and other expenses, e.g., website maintenance. Opening balance 1 January 2014: \$13,074.91; current balance (as of 1 November 2014): \$14,683.03. Major expenses for the year: \$1800 (website maintenance/upgrade), \$420 (maintenance of IEEE literature database), \$2583 (January 2014 meetings – refreshments), \$4314 (September 2014 meeting – meeting rooms, refreshments). Income: \$4426 (registration fees January 2014 meeting), \$6490 (registration fees September 2014 meeting).

### **4.3 TC95 Membership Roster**

(See Tables TC95-2 through Table TC95-7.)

With the leadership of Dr. Michael Murphy, TC95 Membership Chairman, the non-US membership of ICES continues to grow (now greater than 40% of the members are from outside the US). In terms of stakeholders, the membership continues to be well balanced. About 50% of the TC95 membership are IEEE members, not all of which are SA members (there may be more IEEE and IEEE SA members than indicated on Tables TC95-2 thru TC95-7), which is to be expected and defended in view of the interdisciplinary nature of our membership. TC95 is grateful for their voluntary contributions of talent and time under conditions where it would be an unreasonable imposition to require IEEE membership. TC95 recognizes the financial burden for travel and loss of income generating business opportunity already born by many volunteers during TC95 activities. However, IEEE SA membership is required of all TC95 leadership (e.g., Committee and Subcommittee Chairs, Co-Chairs) and is encouraged for all members.

### **4.4 Meetings (2014)**

#### **4.4.1 Main Committee**

##### **4.4.1.1 Past Meetings**

- January 16, 2014 – Plantation, FL
- September 11, 2014 – Pismo Beach, CA

##### **4.4.1.2 Future Meetings**

- June 13, 2015 – Monterey, CA – in conjunction with BIOEM 2015

#### **4.4.2 Subcommittee 1 (Measurements and Computation)**

(SC1 leadership changed following publication of C95.3.1-2010)

##### **4.4.2.1 Past Meetings**

- January 14, 2014 – Plantation, FL
- September 9, 2014 – Pismo Beach, CA

##### **4.4.2.2 Future Meetings**

- June 11, 2015 – in conjunction with BIOEM 2015

#### **4.4.3 Subcommittee 2 (Warning Signs, Symbols and Hazard Communication)**

##### **4.4.3.1 Past Meetings**

- January 14, 2014 – Plantation, FL
- September 9, 2014 – Pismo Beach, CA

##### **4.4.3.2 Future Meetings**

- June 11, 2015 –in conjunction with BIOEM 2015

#### **4.4.4 Subcommittee 3 (Safety Levels – 0-3 kHz)**

##### **4.4.4.1 Past Meetings**

- January 15, 2014 – Plantation, FL
- September 10, 2014 – Pismo Beach, CA

##### **4.4.4.2 Future Meetings**

- June 12, 2015 – Monterey, CA–in conjunction with BIOEM 2015

#### **4.4.5 Subcommittee 4 (Safety Levels – 3 kHz to 300 GHz)**

##### **4.4.5.1 Past Meetings**

- January 15, 2014 – Plantation, FL
- September 10, 2014 – Pismo Beach, CA

##### **4.4.5.2 Future Meetings**

- June 12, 2015 – Monterey, CA–in conjunction with BIOEM 2015

#### **4.4.6 Subcommittee 5 (Safe Distances from Antennas during Blasting Operations)**

The C95.4 standard is stable and the subcommittee has not found it necessary to meet face-to-face since the June 2008 San Diego. However, the new leadership intends to hold a meeting to discuss needs early in 2015 – date TBD.

#### **4.4.7 Subcommittee 6 (EMF Modeling and Dosimetry)**

SC6, which was established at the September 2014 meeting in Pismo Beach, CA, has not met yet but plans to meet at the June 2015 TC95 meetings in Monterey, CA.

## **4.5 Main Committee and Subcommittee Status**

### **4.5.1 Main Committee**

A major effort during the past several years has been to increase the membership of ICES, particularly non-U.S. members. TC95 now has members from Australia (4), Bulgaria (1), Canada (7), China (2), France (2), Finland (1), Germany (1), Greece (4), Hungary (1), India (1), Ireland (4), Israel (2), Italy (3), Japan (5), Korea (4), Malaysia (3), the Netherlands (2), New Zealand (1), Poland (1), Sweden (1), Slovenia (1), Switzerland (2), Thailand (1), Turkey (1), the United Kingdom (2) and the United States (68)—slightly more than 50% of the main committee membership is from outside the US.

The TC95 mailing list now approaches 350, including subcommittee members and observers. Fourteen years ago, the long-standing practice of sending hard copies of our extensive documents through the mail to our global mailing list was discontinued – all communications are now via e-mail and the Internet; meeting minutes are posted on the ICES website. The ICES Website (<http://www.ices-emfsafety.org/>) contains both open and private pages for TC95 and its subcommittees and links to TC34 and its subcommittees. All agendas approved meeting minutes, white papers, RF research databases, draft standard documents, and many special reports are publicly available; certain proprietary or working documents are available only to members of the subcommittees on private sections of the site. The TC95/SC3/SC4 literature database, containing more than 5000 titles, which appeared on the WHO website, is now supported by ICES and appears on their website at <http://www.ieee-emf.com/>. All publicly available papers (titles and abstracts only) are accessible to all members; the complete papers are offered only to members of the TC95/SC3/SC4 literature evaluation working groups.

### **4.5.2 Subcommittee 1 (Measurement and Computation)**

Subcommittee 1 has responsibility for IEEE C95.3 “IEEE Recommended Practice for Measurements and Computations of Radio Frequency Electromagnetic Fields With Respect to Human Exposure to Such Fields, 100 kHz–300 GHz” and IEEE Std C95.3.1-2010, “IEEE Recommended Practice for Measurements and Computations of Electric, Magnetic, and Electromagnetic Fields with Respect to Human Exposure to Such Fields, 0 Hz to 100 kHz” and IEEE 1460, “IEEE Guide for the Measurement of Quasi-Static Magnetic and Electric Fields,” IEEE 1460 has been incorporated into C95.3.1 and will not be revised or reaffirmed.

Work has begun to combine IEEE C95.3 and C95.3.1 into a single standard covering the frequency range of 0 Hz to 300 GHz. A PAR for the revision of C95.3-2002 was approved at the March 2012 NesCom meeting. An initial draft that combines existing IEEE Standards C95.3-2002 (R2007) and C95.3.1-2010 has been prepared and an SC1 balloting draft is now being prepared. (Note that before Sponsor ballot, TC95 subcommittees go through a rigorous ballot process with essentially the same requirements as Sponsor ballot, e.g., ballot groups are formed, 75% response rate and 75% approval rate after ballot resolution is required before a draft standard is moved to Sponsor Ballot.)

#### **4.5.3 Subcommittee 2 (RF Warning Symbols, Safety Programs and Hazard Communication)**

Subcommittee 2 has responsibility for the following standards: IEEE C95.2, “IEEE Standard for Radio-Frequency Energy and Current-Flow Symbols” and IEEE C95.7, “IEEE Recommended Practice for Radio Frequency Safety Programs, 3 kHz to 300 GHz.”

The PAR for the revision of C95.2-1999 (R2006) is active until December 31, 2014. A PAR extension request has not been submitted—SC2 has not yet determined if there are any changes required. This will be discussed at the next meeting and, depending on the outcome, a PAR for a revision may be submitted. (The standard remains active through December 31, 2018.)

The revision of C95.7 was prepared within SC2 and circulated for subcommittee balloting and comment during 2012. Following revision of the document, based on numerous comments, it was anticipated that the document would be submitted for sponsor ballot during the spring of 2013. However, several subcommittee members recommended that the document be held until after the June 2013 meeting in Greece, pending possible comments from international attendees at the meeting. Following the Greece meeting, several relatively minor revisions to the document were made. The revised draft, which had already been balloted and approved at the subcommittee level, was submitted for sponsor ballot on November 27, 2013. The standard was approved by the Standards Board June 12, 2014 and published August 8, 2014.

Future work within Subcommittee 2 will center around new working groups that focus on (1) barriers for excluding persons from entering areas at antenna sites where RF fields may exceed applicable exposure limits, (2) use of safety signage for alerting individuals to the presence of RF fields that may exceed applicable exposure limits and (3) a training guide that would provide minimal requirements for persons to qualify for entering areas wherein RF fields may exceed the uncontrolled exposure limit but would not exceed the controlled environment exposure limit. Progress on the barrier working group was presented at the summer 2014 meeting in Pismo Beach, CA.

#### **4.5.4 Subcommittee 3 (Safety Levels – 0 to 3 kHz)**

There are no active PARs for new or existing projects but members of SC3 are working with members of SC4 on the ongoing revision of C95.1-2005 (PC95.1), which will incorporate C95.6, thereby extending the frequency range from 0 Hz to 300 GHz. Portions of C95.6 were also incorporated into PC95.1-2345, a civil standard considered as a replacement of STANAG 2345, the current NATO RF safety standard. Key members of SC3 continue open dialog with members of organizations with similar interests, e.g., the International Commission on Non-Ionizing Radiation Protection (ICNIRP), Australian Radiation Protection and Nuclear Safety Agency (ARPANSA), WHO, in order to improve procedural and philosophical differences in the rationale and numeric limits of the standards/guidelines. In addition, members of SC3 are also making progress in encouraging further R&D on improvement of induction models and synaptic effects thresholds, including magnetophosphenes in human volunteers for future revision/applications. In order to address issues and inconsistencies in the models and dosimetry used to determine the induced fields in the body (and exposure limits), a new subcommittee (SC6) was recently established (see 4.5.7).

#### **4.5.5 Subcommittee 4 (Safety Levels – 3 kHz -300-GHz)**

Subcommittee 4 has responsibility for the C95.1 standard “IEEE Standard for Safety Levels with Respect to Human Exposure to Electromagnetic Fields, 3 kHz – 300 GHz.”

This standard was first published as a USASI standard in 1966 and revisions were published as ANSI standards in 1974 and 1982. In 1991 a revision was published as an IEEE standard. It was reaffirmed in 1997, a corrigendum published in 1998, a combined edition published in 1999, and an amendment in 2004. The latest revision, C95.1-2005 was approved October 3, 2005 and published April 19, 2006. The revision is the result of a major effort by SC4 to fully review and evaluate the relevant scientific literature. An amendment (C95.1a) that specifies ceiling values for induced and contact current, distinguishes between peak power density and localized exposure, and corrects other technical issues was published in March 2010.

The major effort by SC4 (and SC4) this past year was in revising and combining C95.6-2002, the low frequency (0 Hz – 3 kHz ) safety standard, with C95.1-2005, the RF safety standard (3 kHz to 300 GHz) into a single standard (C95.1-201X – 0 Hz – 300 GHz). Two major hurdles that were overcome: developing limits for contact currents; addressing differences in the approaches for defining adverse effect thresholds, i.e., effects associated with electrostimulation (low frequencies) and effects associated with tissue heating (high frequencies). Specifically, the question of whether the adverse effects level at high frequencies (a threshold model) should be determined using a probabilistic model (as for low frequencies). After much discussion, it was decided to keep the two different approaches.

The first combined standard covering frequencies from 0 Hz to 300 GHz, IEEE C95.1-2345, “IEEE Standard for Military Workplaces – Force Health Protection Regarding Personnel Exposure to Electric, Magnetic and Electromagnetic Fields, 0 Hz to 300 GHz,” was approved by the Standards Board on April 18, 2014, and published May 30, 2014. Following ratification by the by NATO member countries, this standard will be used in NATO and military installations replacing NATO STANAG 2345 (Edition 3). The development and revision of the C95.1 standards is carried out by an editorial working group that meets about four times per year face-to-face and several times by teleconference. The working group, with members from both SC3 and SC4, prepares the drafts and addresses comments received by the subcommittees following circulation of each draft.

The exposure values and basic restrictions continue to be based on a critical review of the relevant scientific literature. RF literature surveillance is ongoing. Literature review has started with the selection of topic WG Chairs and members. The research selection of topics and proposed authors to initiate the creation of white papers summarizing the findings pertaining to health concerns is ongoing.

SC4 continues to pursue the investigation of relationships between localized tissue temperature increase and peak spatial-average SAR (100 kHz to 3 GHz) and power density (3 GHz to 300 GHz) as a basis for a decision on the need to revise the limits for localized exposure at frequencies from 100 kHz to 300 GHz. Although numerous studies that report effects at levels below those where thermal mechanisms would prevail, all reliable evidence indicates that established adverse effects are thermal in nature and, therefore, changes in temperature under localized exposure conditions is important with respect to devices that produce such exposures, e.g., mobile telephones. The results would provide a scientifically sound basis for the current SAR limits for localized exposure or the basis for a change.

An ad hoc committee has been established to address bio-effects at THz frequencies. This is the continuation of a joint effort between members of SC4 and ANSI ASC Z136

(laser safety) that began informally in 2000. While there was little data in 2000, there is a growing body of data that can be used to provide additional science-based support for reaffirming or revising the maximum permissible exposure values at 300 GHz (the upper frequency of IEEE C95.1 and the lower frequency of ANSI Z136.1). There is close coordination between ICES and ANSI ASC Z136 (ICES Secretary, Ron Petersen, chaired the Z136 committee from 2000 until 2009.)

#### **4.5.5.1 Issues: Justification of the lower tier of exposure limits**

Over the past few years there has been considerable discussion within SC3 and SC4 regarding the rationale and need for the lower tier of exposure limits for the general public. In order to stimulate discussion on the inherent conservatism built into the C95.1 standard, SC4 members Bergeron and Tell drafted a paper “IEEE Standard C95.1 on Radiofrequency Electromagnetic Safety: Considerations of Conservatism.” The paper was circulated to the subcommittees for review and comment and posted on the ICES website. The authors believe that justification of a lower tier of exposure limits demands clarification in order to distinguish their basis from that used to justify the upper tier. Specifically, it is argued that the language of the standard must recognize the non-scientific basis for the lower tier limits, and whether a lower tier is necessary in future standards. The paper stimulated discussion at the ICES Pismo Beach, CA, meeting, which will continue online and at the June 2015 meeting.

#### **4.5.6 Subcommittee 5 (Safe Distances from Antennas during Blasting Operations)**

Subcommittee 5 is responsible for C95.4-2002 (IEEE Recommended Practice for Determining Safe Distances from Radio Frequency Transmitting Antennas When Using Electric Blasting Caps during Explosive Operations). The standard was reaffirmed at the March 2008 SASB meeting. The standard is stable and there are no PARs for new or existing projects.

#### **4.5.7 Subcommittee 6 (EMF Modeling and Dosimetry)**

The aims of this new subcommittee (established September 2014) are: resolution of uncertainties in the dosimetric data used for the development of dosimetric reference limits and exposure reference levels (the bases of standards and guidelines for human exposure to electric, magnetic and electromagnetic fields); recommend analytical tools and data applicable to human exposure standards, follow and assess the recent literature on EMF dosimetry modeling, both for nerve stimulation effects caused by exposure to electric, magnetic and electromagnetic fields at frequencies below ~100 kHz, and for heating effects caused by RF energy absorption at frequencies above ~100 kHz. SC-6 will coordinate closely with the other subcommittees, especially with Subcommittee 3 and Subcommittee 4, both of which are currently working on the update and merger of IEEE Std C95.1<sup>TM</sup>-2005 and IEEE-Std C95.6<sup>TM</sup>-2002 (Reaffirmed 2007) into a single standard that covers the frequency range of 0 Hz to 300 GHz.

As a key activity, SC6 is now planning a workshop that will take place in Monterrey, California on June 14, 2015 (following the June 11 – 13 TC95 meetings), and immediately before and at the same venue as BioEM2015 (which begins the evening of June 14, 2015). Approximately 10 speakers covering three main topics are expected: (1) Induction modeling; (2) Electrostimulation modeling; (3) Combined induction and electro-stimulation, including experimental verification. A panel discussion, including a

Q&A session, at the end of the formal presentations will be included. An audience of 100 persons is expected.

#### **4.6 PARs**

The following TC95 PARs are currently active:

##### **4.6.1 SC1 PARs**

###### **PC95.3 (Approved February 2012)**

**Title:** Recommended Practice for Measurements and Computations of Electric, Magnetic and Electromagnetic Fields With Respect to Human Exposure to Such Fields, 0 Hz-300 GHz.

**Status:** Revision Project

**Project Scope:** This recommended practice describes methods for measuring and computing external electric, magnetic and electromagnetic fields to which persons may be exposed over the frequency range of 0 Hz to 300 GHz. Instrument characteristics and the methods of calibrating such instruments and methods for computation and the measurement of the resulting fields and currents that are induced in bodies of humans exposed to these fields are included.

##### **4.6.2 SC2 PARs**

###### **4.6.2.1 PC95.2 (Approved November 2010)**

**Title:** Standard for Radio-Frequency Energy and Current-Flow Symbols

**Status:** Revision Project

**Project Scope:** This standard provides a description of warning symbols for radio frequency radiation and radio frequency induced and contact currents in the frequency range of 3 kHz to 300 GHz.

**Project Purpose:** The purpose of this standard is to provide guidance on the standardized design of warning symbols that may be used on alerting signs for informing individuals of the potential for exposure to electric, magnetic and electromagnetic fields and associated induced and contact currents and contact voltages.

##### **4.6.3 SC3/4 PARs**

###### **4.6.3.1 PC95.1 (Approved June 2010 – PAR Extension Request was submitted to NesCom for consideration at the December 2014 Standards Board series)**

**Title:** Standard for Safety Levels with Respect to Human Exposure to Electric, Magnetic and Electromagnetic Fields, 0 Hz to 300 GHz

**Status:** Revision Project

**Project scope:** Recommendations are made to protect against established adverse health effects in humans resulting from exposure to electric, magnetic and electromagnetic fields in the frequency range of 0 Hz to 300 GHz. The recommendations are expressed in terms of exposure reference levels (ERLs) and dosimetric reference levels (DRLs). The DRLs are limits on in situ electric field strength, specific absorption rate (SAR), and incident power density; the ERLs, which are derived from the DRLs, are limits on external fields and induced and contact current. This standard is intended to apply to all human exposures except for exposure of patients under medical supervision. The recommendations are not intended for the

purpose of preventing interference with medical and other devices that may exhibit susceptibility to radio frequency (RF) fields. The recommendations at 300 GHz are consistent with existing recommendations for safe exposure in the infrared frequency range, which begins at 300 GHz, cf., ANSI Z136.1, and IEC 60825-1.

**Project purpose:** The purpose of this standard is to provide rational, science- based exposure values to protect against established adverse effects to human health induced by exposure to electric, magnetic, and electromagnetic fields over the frequency range of 0 Hz to 300 GHz.

#### **4.7 Objectives and Goals for 2014 and the TC's performance relative to meeting these goals and objectives.**

- Complete Sponsor balloting on PC95.1-2345. (SC3/SC4 – 1<sup>st</sup> Q 2014: Met)
- Begin Subcommittee balloting on PC95.1. (SC3/SC4 – 2<sup>nd</sup> Q 2014: Not met)
- Begin Subcommittee balloting on PC95.3. (SC1 – 2<sup>nd</sup> Q 2014: Not Met)
- Initiate Sponsor balloting on PC95.7. (SC2 – 1<sup>st</sup> Q 2014: Met)
- Resolve comments from Sponsor ballot on PC95.7. (SC2 – 2<sup>nd</sup> Q 2014: Met)
- Submit PC95.7 to RevCom. (SC2 – 3<sup>rd</sup> Q 2014: Met)
- Complete Subcommittee balloting on PC95.1. (SC3/SC4 – 4<sup>th</sup> Q 2014: Not met)

#### **4.8 Objectives and Goals for 2015 with milestones indicated**

- Initiate subcommittee balloting on PC95.3 (SC1 – 3<sup>rd</sup> Q 2015)
- Complete the establishment of the literature evaluation WG. (SC3/SC4 – 1<sup>st</sup> Q 2015)
- Initiate Subcommittee balloting on PC95.1. (SC3/SC4 – 4<sup>th</sup> Q 2015)
- Decide whether IEEE C95.4 should be updated and submit PAR if the decision is positive. (SC5 – 2<sup>nd</sup> Q 2015)

#### **4.9 IEEE Staff**

Support in setting up meetings at IEEE Piscataway has been required in the past and may be in the future; availability of the IEEE Staff Engineer at meetings held at IEEE is desirable. The engineering background and broad knowledge of IEEE procedures of Ms Joan Woolery and Tricia Gerdon, Staff Liaison for both TC34 and TC95, is invaluable to this committee.

#### **4.10 Other Activities:**

Members of ICES TC95 are continually involved in a wide spectrum of activities that relate to standard-setting including research, education, and drafting of regulations. Members participate in the governmental activities in many nations, as well. These include the FCC and FDA in the US, the EU/EC in Europe, and Standard setting bodies in China. TC95 members participate in the broad activities of the WHO and its EMF Project as well as the European EBFA, and in various other meetings around the world.

## **4.11 Issues**

### **4.10.1 Recognition of C95 measurement standards by IEC TC106**

ICES has twice submitted without success IEEE C95.3-2002 to the IEC for consideration as an IEC/IEEE dual logo standard. The issue seems to focus on objections by a number of EU countries who are looking for a standard that specifically addresses EC Directives, e.g., CENELEC standards that contain exposure limits (ICNIRP). It is unlikely that further attempts will succeed as C95.3 is being revised and expanded to include C95.3.1-2010.

### **4.11.2 Interaction with ICNIRP**

Members of ICES have tried unsuccessfully to coordinate harmonization activities with the International Commission on Non-Ionizing Radiation Protection (ICNIRP). ICNIRP, a group of 14 individuals develops safety limits for exposure to electromagnetic energy over the frequency range of 0 to 300 GHz, i.e. the same frequency range as IEEE C95.6 (0 Hz – 3 kHz) and C95.1 (3 kHz – 300 GHz). The ICNIRP process for developing guidelines is closed and relies on claims of “no commercial vested interests” to maintain “credibility,” especially within the EU states. Since there is no stakeholder involvement, it is not clear how they will deal with “Consideration of Implementation in Practice” in their process. Members of the ICES AdCom have met several times with members of ICNIRP (twice at ICNIRP’s request) to discuss methods of coordination but attempts at sharing documents are one-way only.

ICES will continue to discuss the IEEE standards and process at major international fora to help recruit key scientists and engineers who have no other way of participating in setting safety standards. Indications are that there may be a closer relationship with ICNIRP in the future. This stems from an issue in the EU whereby a European Commission (EC) Worker Safety Directive to implement ICNIRP-based guidance in the workplace was initially delayed because of impacts to several stakeholder groups, including MRI operators performing certain interventional procedures, would be exposed to low frequency magnetic fields in excess of the ICNIRP limits. The relevant ICNIRP limits are far more restrictive than those of IEEE C95.6 and the incorporation of extremely large safety factors in the ICNIRP limits has never been explained. TC96/SC6 was established to reconcile issues related to dosimetry and induction models in order to reconcile the differences. Additional stakeholder impacts included industry (welders and heat-sealer operators) and military (induced and contact current impacts on operations).

Some of these issues were discussed at a roundtable symposium on exposure standards at the 2008 meeting of the Bioelectromagnetics Society. Dr. C-K Chou (TC95 Chair) represented ICES and Paolo Vecchia (ICNIRP Chair) and James Lin represented ICNIRP. A similar forum was also held at the 2011 meeting of the Bioelectromagnetics Society, where Dr. C-K Chou represented ICES and Dr. Bernard Veyret represented ICNIRP. This roundtable provided a forum to promote further harmonization of the two major international standards. More recently, the impacts of the EC Directive were discussed and debated at a meeting of stakeholders in Umea, SWE 6-8 October 2009, where Drs. C-K Chou and J. Patrick Reilly described the IEEE standards, and TC95 and ICES. Dr. Klauenberg, serving as NATO stakeholder to the EC, described critical impacts of the proposed EC Directive 2004-40-EC to military operations and argued for changes subsequently made in IEEE C95.1-2345-2014. Additionally, the announcement that IEEE C95 standards were publicly available was enthusiastically received by the international community furthering international recognition of IEEE standardization.

The EC representative challenged the chairs of ICNIRP and ICES to explain why they could not meet to harmonized standards, Dr. Ralf Bodemann emphasized the ICES willingness to meet with ICNIRP to further harmonization of standards. Unfortunately, ICNIRP continued to be reluctant claiming it would destroy its credibility by working with a group that included industry. The stakeholders in attendance were largely impressed with the IEEE process and position on harmonization. In June 2011, another standards harmonization session was held at the Bioelectromagnetics Society Annual Meeting in Halifax, Canada. Dr. C-K Chou (TC95 Chair) represented ICES; Dr. Bernard Veyret represented ICNIRP. In November 2013, C-K Chou presented “Update of IEEE EMF Exposure Standards Activities,” and James Lin presented an update of the ICNIRP Guidelines and activities at the GLORE (Global Coordination of Research and Health Policy on Electromagnetic Fields) meeting held at the FCC (November 14 – 15).

#### **4.11.3 Responding to Advocacy Groups**

A major ICES concern has been responding to advocacy groups that are gaining an increasing stronger foothold, particularly outside of North America. Most notable are the advocates of the *BioInitiative Report* (a non-peer reviewed selective, rather than comprehensive, review of the literature that mixes discussions on science with social issues). This group has gained momentum pushing for unrealistic restrictive standards and policies that must be continually rebutted. In 2009, the EMB-S Committee on Man and Radiation (COMAR – which is made up mostly of ICES members) published a peer reviewed article in *Health Physics* that spotlights errors and inconsistencies in the web published *BioInitiative Report*. IEEE/ICES experts need standards developmental organizational support in countering unscientific claims that would be catastrophic if implemented as law or regulation. In the 2012 revision of the *BioInitiative Report*, the authors of the final chapter (written by two individuals without consulting other authors of the report) recommend a precautionary exposure limit of  $0.3 \text{ nW/cm}^2$  for RF exposure, which would essentially shut down radio communications.

#### **4.12 Membership**

See Tables TC95-1 through Table TC95-7 for committee and subcommittee membership information.
